LOT 310 - Skid Steer Vibratory Roller (New/Unused)

Description

Skid Steer Vibratory Roller – Compaction Power with Notched or Padded Versatility

The **Skid Steer Vibratory Roller** with a notched or padded drum design is a heavy-duty compaction attachment built for compacting soil, gravel, asphalt, and aggregate in construction, landscaping, and roadwork applications. The vibratory function delivers powerful downward force to increase soil density and stability, while the **notched or padded drum** provides added traction and better performance on cohesive or uneven materials.

Key Uses and Benefits:

- Compact subgrades, foundations, and roadbeds with high efficiency
- Improve soil density for concrete pads, driveways, and paving prep
- Use padded or notched drums for effective compaction on clay or wet soils
- Compact trenches and backfill in confined areas

- Ideal for grading contractors, landscapers, and utility crews

Designed to attach directly to a skid steer loader, this roller delivers the maneuverability needed for tight spaces along with the compaction force typically found in much larger machines. The padded or sheepfoot-style design is especially useful for jobs requiring deep soil penetration and effective moisture displacement.

5-16GPM

Working Width: 59"

Quantity: 1
